Majour Fintech Sandbox application

Name of Business:

Majour Fintech

Business Domain:

Health FinTech (Technology Company – specialized in financial solutions for the healthcare sector)

Address:

Building No. 3013, Prince Fawaz Ibn Abdulaziz Street, Ar Rabwah District, 7281, Postal Code 12813, Riyadh, Kingdom of Saudi Arabia

Phone / Email / Website:

Phone: +966500520242

Email : theeb@theeb.studio

Website: Under Development

Brief Description of Applicant:

Majour Fintech is a Saudi-based Health FinTech company specialized in developing digital financial solutions for the healthcare sector. Its core innovation is a value-based health financing and reward system that integrates patient-reported outcomes (PROMs), smart contracts for providers, and value-based insurance models. The company is currently developing its initial prototype with a dedicated team, aiming to align with Saudi Arabia's healthcare transformation goals by enabling outcome-based financing, improving quality of life, and reducing inefficiencies in healthcare spending.

SAMA:

A. Are your business or associated entities authorized or registered by SAMA?

No, Majour Fintech and its associated entities are not currently licensed or authorized by SAMA. The group operates under healthcare licenses via subsidiaries (e.g., Integra RCM, Integrative Health Holding). The company is applying to SAMA's Sandbox specifically to validate a regulated Health FinTech activity under supervision.

B. Does your business require a temporary SAMA registration number for the duration of the test?

Yes, we request a temporary SAMA registration number for the sandbox testing period. The activity (value-based health financing, issuance of patient/provider incentives, and smart contract–based claims financing) falls under financial services and requires regulatory oversight. The Sandbox license will allow us to legally test these activities in a live environment.

C. Is your business already active in the KSA or abroad?

Yes. Majour Fintech and its parent ecosystem (Integra RCM, Integrative Health Holding) are fully operational in the Kingdom. We manage revenue cycle operations for over 40 hospitals and clinics, and provide urgent care, home care, telemedicine, logistics, and VBHC-related services. The applicant has no active presence abroad.

D. Are you planning to work with another company or bank to undertake this test?

Yes, we intend to collaborate with Saudi insurers (via MoUs), selected hospitals, and wellness ecosystem partners (pharmacies, gyms, digital health platforms). Contractual agreements are under preparation for pilot participation.

Section 3: About Your Innovation

Why test in the Sandbox with real customers?

Live testing is critical because the innovation links real financial flows (claims, tokens, settlements) to health outcomes. Simulations cannot replicate fraud patterns, real patient engagement, or insurer-provider behavior. Testing in Sandbox ensures regulatory safety while validating consumer benefit.

Readiness for testing:

The prototype (MVP) is developed and backed by two decades of operational presence, existing partnerships, and access to hospitals and insurers. The team has completed technical due diligence and risk assessment. We are ready to deploy the MVP with real customers immediately upon approval.

3.1 What is your innovation?

Our innovation is a Health FinTech platform that introduces a value-based financing and reward system in the healthcare sector. It combines:

- Patient engagement: Patients receive financial rewards (cashback or tokenized points) for documenting their health outcomes (PROMs) and compliance with treatment and preventive activities.
- Provider incentives: Hospitals, doctors, and care teams document quality of service through transparent performance indicators and receive faster payment settlements and better pricing.
- Payer benefits: Insurers, employers, or public health funds ensure fraud-free, outcome-based healthcare services that reduce waste and financial loss, supported by smart financing products for claims and invoices.

- Regulatory alignment: The platform enables regulators and policymakers to transition from traditional fee-for-service financing to smart contracts linked to measurable outcomes, in line with Vision 2030 healthcare transformation.

3.2 How is it different from what exists in the market?

Currently, healthcare financing in Saudi Arabia is largely fee-for-service and claim-based, with high administrative costs, delays in payment, and risks of fraud and inefficiencies. Our solution is different because it:

1. Links financing directly to value and outcomes rather than volume of services.
2. Creates a digital health wallet where patients and providers earn incentives that can be spent in a health-aligned ecosystem (pharmacies, gyms, wellness services).
3. Integrates smart contracts that automate claim validation, payment acceleration, and provider performance-based pricing.
4. Bridges healthcare and fintech by offering innovative financing mechanisms (claims financing, invoice factoring, reward tokens) tailored for the health sector.

3.3 What problem does it solve?

The innovation addresses three core problems in healthcare financing today:

1. High inefficiency and waste: 15–25% of insurance premiums go to brokers and claims management instead of patient care.
2. Delayed payments to providers: Hospitals often wait months to receive payments, leading to financial strain and reduced service quality.
3. Low patient engagement: Patients are not incentivized to follow treatments, fill surveys, or adopt preventive health behaviors.

Our solution solves these issues by redirecting part of the insurance premium (10–15%) into a value-based smart contract layer, ensuring faster payments, measurable quality, and active patient participation.

3.4 What technology does it rely on?

The solution relies on a FinTech + HealthTech hybrid stack:

- Smart contracts with transparent financing.
- Digital wallets for patients, providers, and insurers.
- PROMs/PREMs data integration for outcome tracking.
- APIs connecting with insurance companies, healthcare providers, and wellness partners.
- Advanced analytics and AI for fraud detection, risk scoring, and value-based pricing.

Section 4: About Your Business Model

4.1 How does your business make money?

Majour Fintech generates revenues through multiple streams:

1. **Transaction fees:** A small percentage (0.5% – 2%) from each payment or settlement processed on the platform.
2. **Subscription fees (B2B SaaS):** Hospitals, clinics, and insurers pay recurring fees to access smart contract tools, dashboards, and APIs.
3. Token issuance & distribution: Employers, insurers, and public health funds purchase digital tokens in bulk to distribute as patient and provider incentives.
4. **Claims and invoice financing:** The platform provides early payment to providers for insurance claims, charging a financing margin.
5. **Data & analytics services:** Aggregated and anonymized health outcomes and performance data are sold as insights to insurers, regulators, and health funds.
6. **Ecosystem partnerships:** Pharmacies, gyms, and wellness services pay commissions or partnership fees when tokens are redeemed with them.

4.2 Who are your target customers?

1. Patients: Who receive rewards for engaging with their care and can spend them on health-related goods and services.
2. Healthcare providers (hospitals, clinics, doctors, allied health teams): Who use smart contracts for faster payments and better pricing.
3. Payers (insurance companies, employers, public health funds, charitable health endowments): Who benefit from reduced fraud, measurable outcomes, and lower waste.
4. Regulators and policymakers: Who gain visibility into performance and progress toward value-based healthcare transformation.

4.3 What is the size of your potential market?

- The Saudi healthcare insurance market is currently valued at approximately SAR 40 billion annually and is projected to grow to SAR 300 billion by 2030 with the introduction of the national health insurance program.
- Capturing 10–15% of each insurance premium through the value-based smart contract layer represents a potential annual revenue pool of SAR 4–6 billion today, and SAR 30–45 billion by 2030.
- The total addressable market (TAM) includes all insured patients, healthcare providers, and insurers in the Kingdom, with scalability into GCC and regional markets.

4.4 What are the key risks and how do you mitigate them?

Risks:

- Operational risks: outages, data loss → mitigated with redundancy & backups.
- Cybersecurity risks: hacking, data breaches → mitigated via encryption, audits, penetration testing.
- ML/TF risks: system misuse → mitigated by KYC/AML compliance and closed health ecosystem.
- Financial crime risks: fraud, identity theft → mitigated by token traceability, biometric login, AI fraud detection.
- Conduct risks: misuse of vulnerable patients → mitigated by clear consumer consent, education, SAMA Consumer Protection Principles.
- Legal risks: partner disputes → mitigated via clear contracts and regulatory oversight.

Mitigation approach:

- Continuous monitoring during test.
- Independent audits.
- Immediate exit plan if risks exceed thresholds

Section 5: About Your Readiness

5.1 What stage is your product at?

Our product is at the prototype stage with strong market readiness. Unlike a greenfield startup, we are building on top of two decades of operational healthcare and fintech-related experience. A first MVP is under development focusing on maternal care and chronic disease management pilots.

5.2 What resources do you already have?

- Operational footprint: Through Integra RCM, we already operate revenue cycle management for more than 40 hospitals and polyclinics in Saudi Arabia.
- Healthcare platform: Through Integrative Health Holding, we provide value-based services including TAP (pharmacy logistics), urgent care, home care, telemedicine, and mother & baby services.
- Track record: Over 20 years of experience in the Saudi healthcare and insurance ecosystem.
- Technical resources: In-house and partner development teams for smart contracts, health wallets, and analytics.

5.3 **What regulatory approvals or licenses do you already have?**

- Currently operating under existing healthcare licenses via our subsidiaries and service platforms.
- No fintech or insurance license yet; hence, we are applying to SAMA's Regulatory Sandbox to test this model under regulatory supervision.
- Future alignment with CHI (for value-based contracting) and CMA (for tokenization models) is under consideration.

Section 6: About Your Testing in the Sandbox

6.1 What do you want to test in the Sandbox?

We want to test a Health FinTech platform that links healthcare financing directly to outcomes through smart contracts and digital health tokens. Specifically, we will test:

1. Digital health wallets for patients, providers, and insurers.
2. Patient reward mechanisms (cashback/token points) tied to PROMs, PREMs, and compliance.
3. Provider incentives for documenting outcomes and quality, including faster settlements and improved pricing.
4. Smart contract layer managing 10–15% of insurance premiums to replace brokers and claims management inefficiencies.
5. Integration with insurers and employers to pre-fund tokens and distribute them as incentives.
6. Redemption ecosystem where patients spend rewards on pharmacies, gyms, and wellness services.

6.2 What hypotheses are you testing?

- Hypothesis 1: Linking patient engagement (PROMs/Compliance) with financial rewards increases adherence and improves health outcomes.
- Hypothesis 2: Smart contracts reduce fraud, accelerate claim settlement, and lower administrative costs compared to traditional claims management.
- Hypothesis 3: Providers are more willing to share quality/outcome data when linked to faster payments and better reimbursement rates.
- Hypothesis 4: Insurers and employers save costs and reduce waste by funding a value-based incentive layer.
- Hypothesis 5: Patients value and adopt health tokens when they can redeem them for everyday health-related purchases.

6.3 What are the success metrics?

- Patient adoption: % of eligible patients who engage with PROMs and redeem tokens.
- Provider participation: Number of hospitals/clinics/doctors using smart contracts and reporting outcomes.
- Payment efficiency: Reduction in average claim settlement time (target: from months → days).
- Fraud reduction: % decrease in suspicious/rejected claims due to smart contract validation.
- Financial sustainability: % of token pool funded by insurers/employers; platform transaction revenue achieved.
- Regulatory alignment: Compliance with SAMA Sandbox requirements and ability to demonstrate safe, transparent financial flows.

Section 7: Additional Information or Supporting Documents

7.1 Additional Information

Majour Fintech is uniquely positioned to pilot this innovation in Saudi Arabia because:

- Operational footprint: We already manage revenue cycle operations for 40+ hospitals and polyclinics through Integra RCM.
- Integrated healthcare services: Through Integrative Health Holding, we provide urgent care, home care, pharmacy logistics, telemedicine, and mother & baby services — ensuring direct integration into the ecosystem.
- Market credibility: The founding team has over 20 years of experience in the Saudi healthcare and insurance markets.
- Strong partnerships: We have signed MoUs with multiple insurers and medical societies, demonstrating broad support and readiness for pilots.
- Alignment with Vision 2030: The model directly supports Saudi Arabia's healthcare transformation by moving from fee-for-service to value-based, smart financing models, improving quality of life and longevity outcomes.

Cybersecurity & safety measures:

- Data stored in KSA (local cloud providers compliant with SAMA Cybersecurity Framework).
- End-to-end encryption (AES-256), multi-factor authentication, and role-based access.
- Penetration testing, vulnerability assessments, and independent security audits before launch.
- Compliance with SAMA Cybersecurity Framework and Saudi health data regulations.

KPIs:

- Patient adoption rate (% PROMs filled, % wallet usage).
- Provider adoption (% hospitals using smart contracts).
- Payment efficiency (average claim settlement time).
- Fraud reduction (% decrease in rejected/suspicious claims).
- Financial sustainability (% token pool funded by insurers, revenues generated).

AML & CFT compliance:

- Full adherence to AML/CFT laws.
- KYC (Know Your Customer) for patients, providers, and merchants.
- Transaction monitoring and suspicious activity reporting (SAR).
- Restrictions to health-related spending only, limiting AML/TF exposure.

Technology infrastructure & location:

- Infrastructure hosted in Saudi-based cloud (SDAIA/SDA–approved provider).
- APIs for integration with insurers, hospitals, and merchants.
- Security risk assessment to include penetration testing, gap analysis vs. SAMA Cybersecurity Framework.

7.2 Supporting Documents

- Company profile of Majour Fintech.
- Overview of Integra RCM operations (40+ hospitals and clinics).
- Overview of Integrative Health Holding services.
- Copies of signed MoUs with insurers and medical societies.
- Technical concept note on the Health FinTech platform and token reward system.
- Founders' CVs highlighting healthcare, fintech, and bioethics expertise.

Majour Fintech represents a unique convergence of healthcare expertise and financial innovation. By introducing a value-based smart contract and patient reward system, we aim to significantly reduce inefficiencies in healthcare financing, improve patient engagement, and accelerate payments to providers. Our strong operational presence, proven partnerships, and alignment with national health transformation goals make us an ideal candidate for testing within SAMA's Regulatory Sandbox. We respectfully request the opportunity to collaborate with SAMA and other regulators in validating this model, ensuring it delivers safe, ethical, and impactful outcomes for all stakeholders in the Saudi healthcare ecosystem.
